

Distortion of Fabrics

TYVEK film is made from fine, high density, non-toxic, spun polyethylene fibres. This product offers all the characteristics of paper, film and fabric in one material. With the application of heat, it changes form, shrinking, bubbling and distorting to give a range of interesting textures and shapes.

Colour your Tyvek using any colouring products that will withstand heat. Using a heat gun, apply heat to the areas you wish to distort. Your distorted piece can be further decorated with stitching, beading and sewn onto fabric by machine or hand.
